ARCHAEOLOGY Part 1

PLANTING THE SEEDS

SUMMER 1974

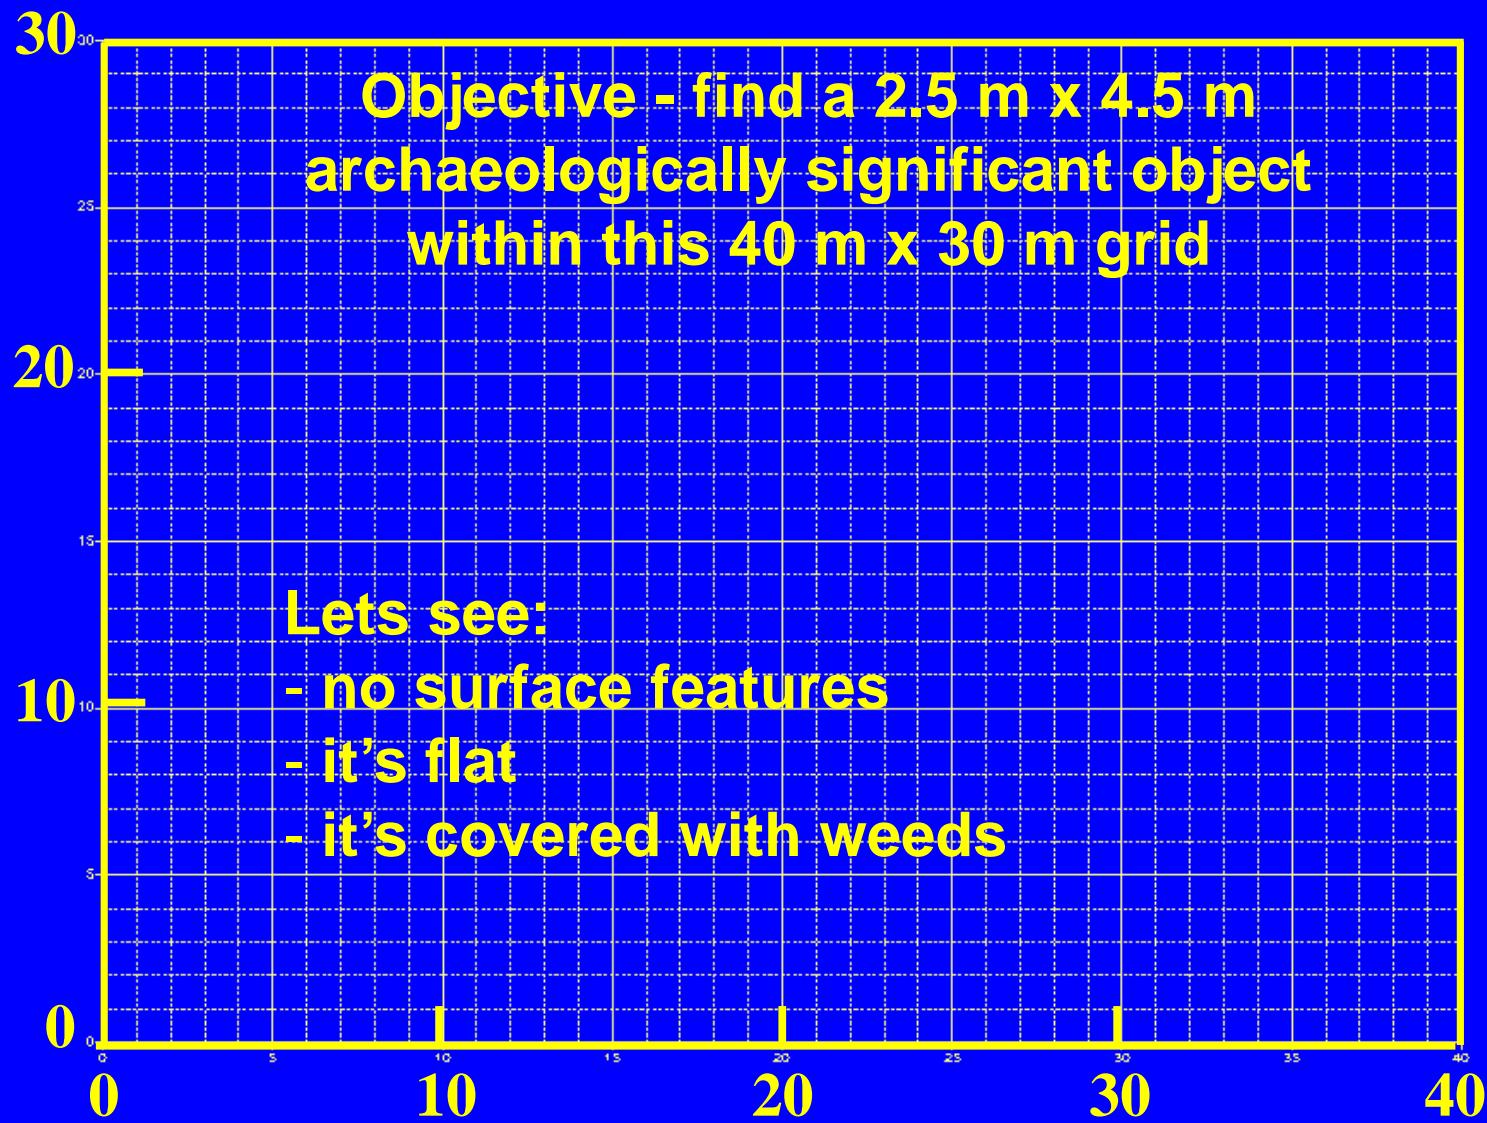

Lesson Learned No. 1

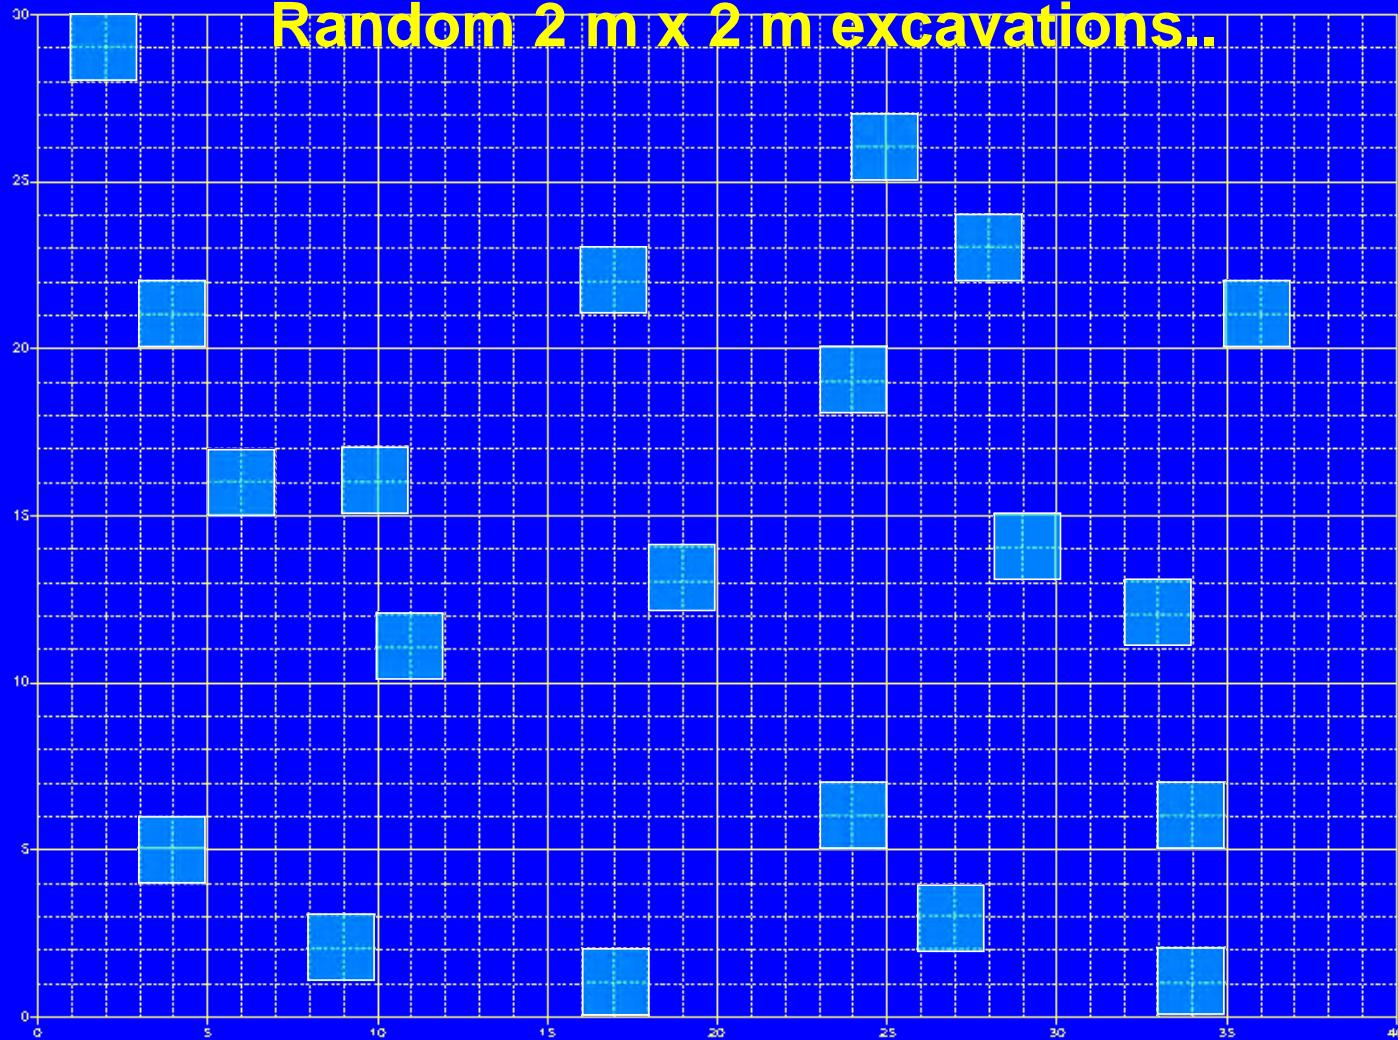

Subsurface exploration is exciting and fun....when
you find something of value!

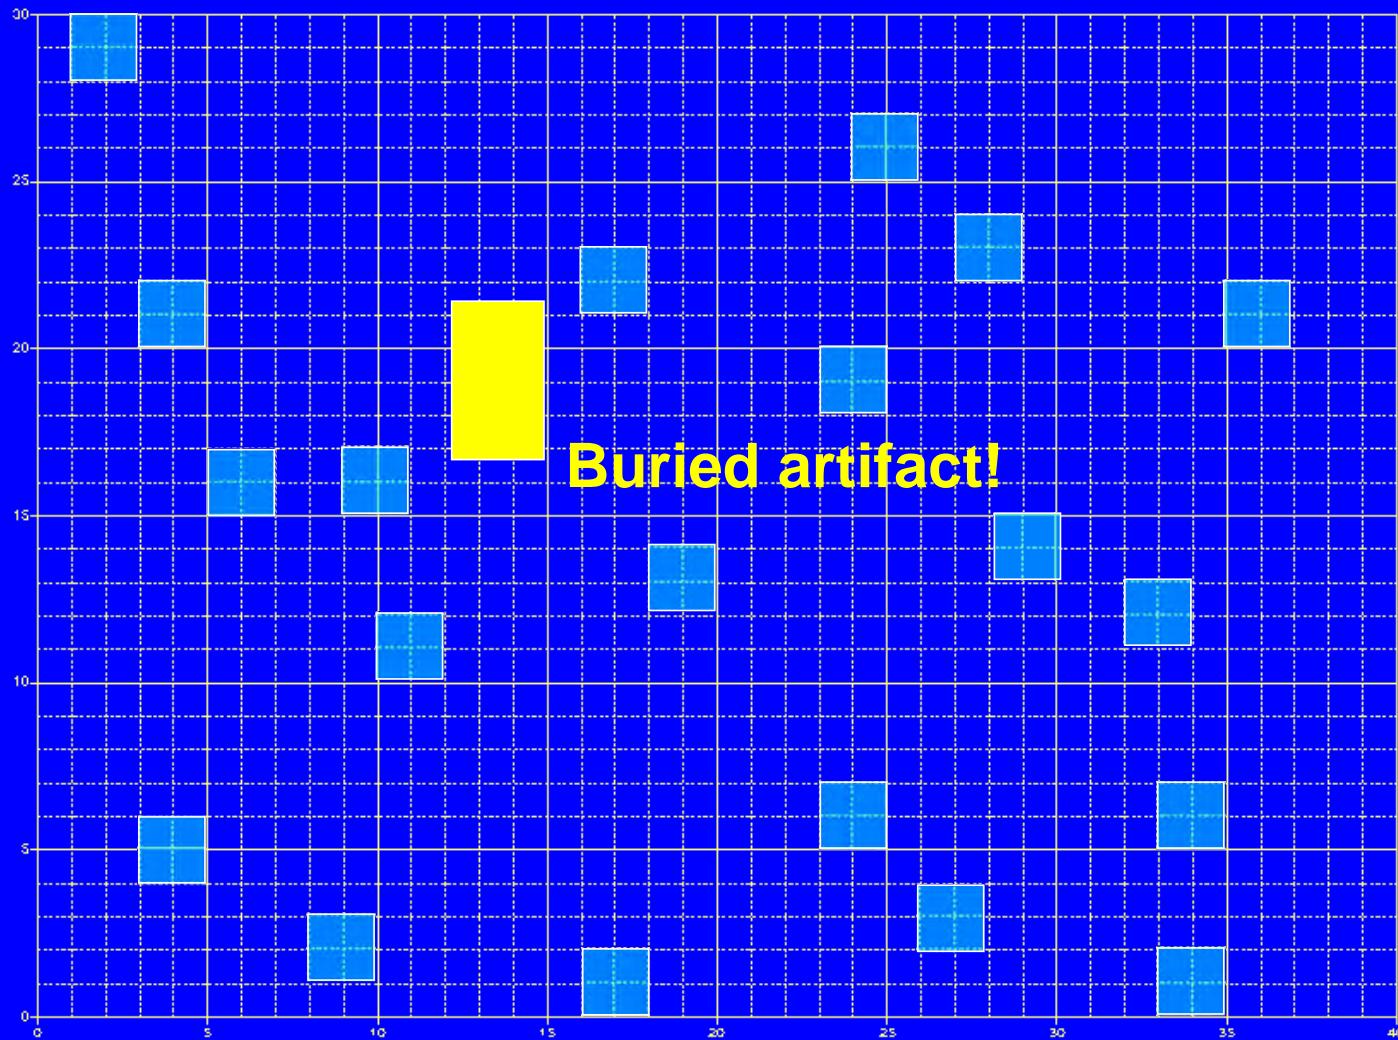

When you don't (and miss it)....it sucks!

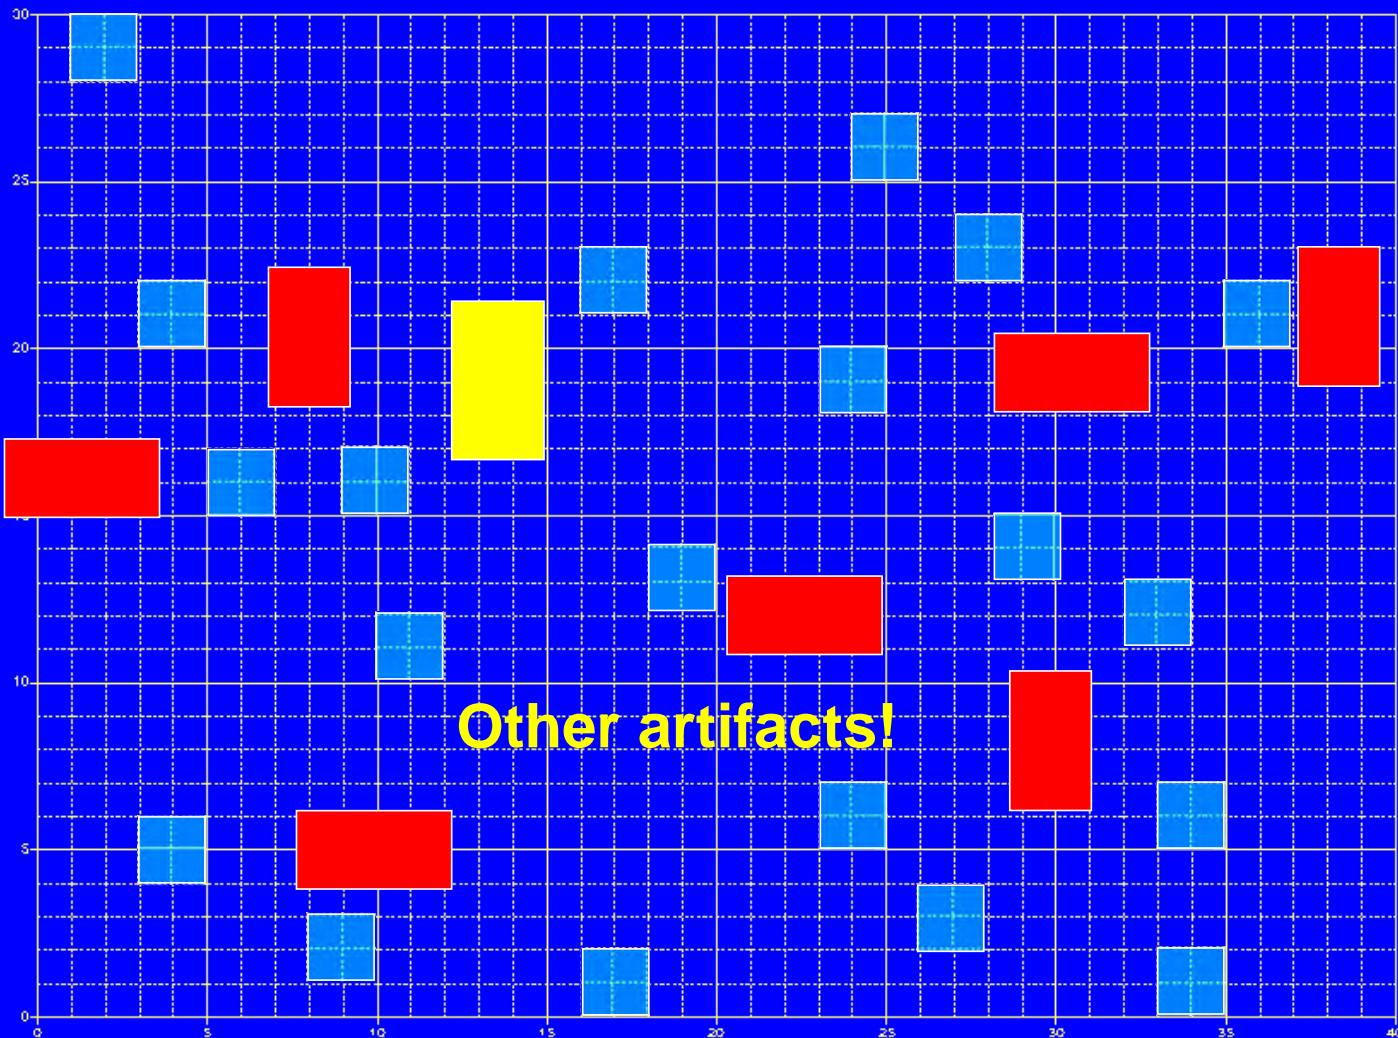

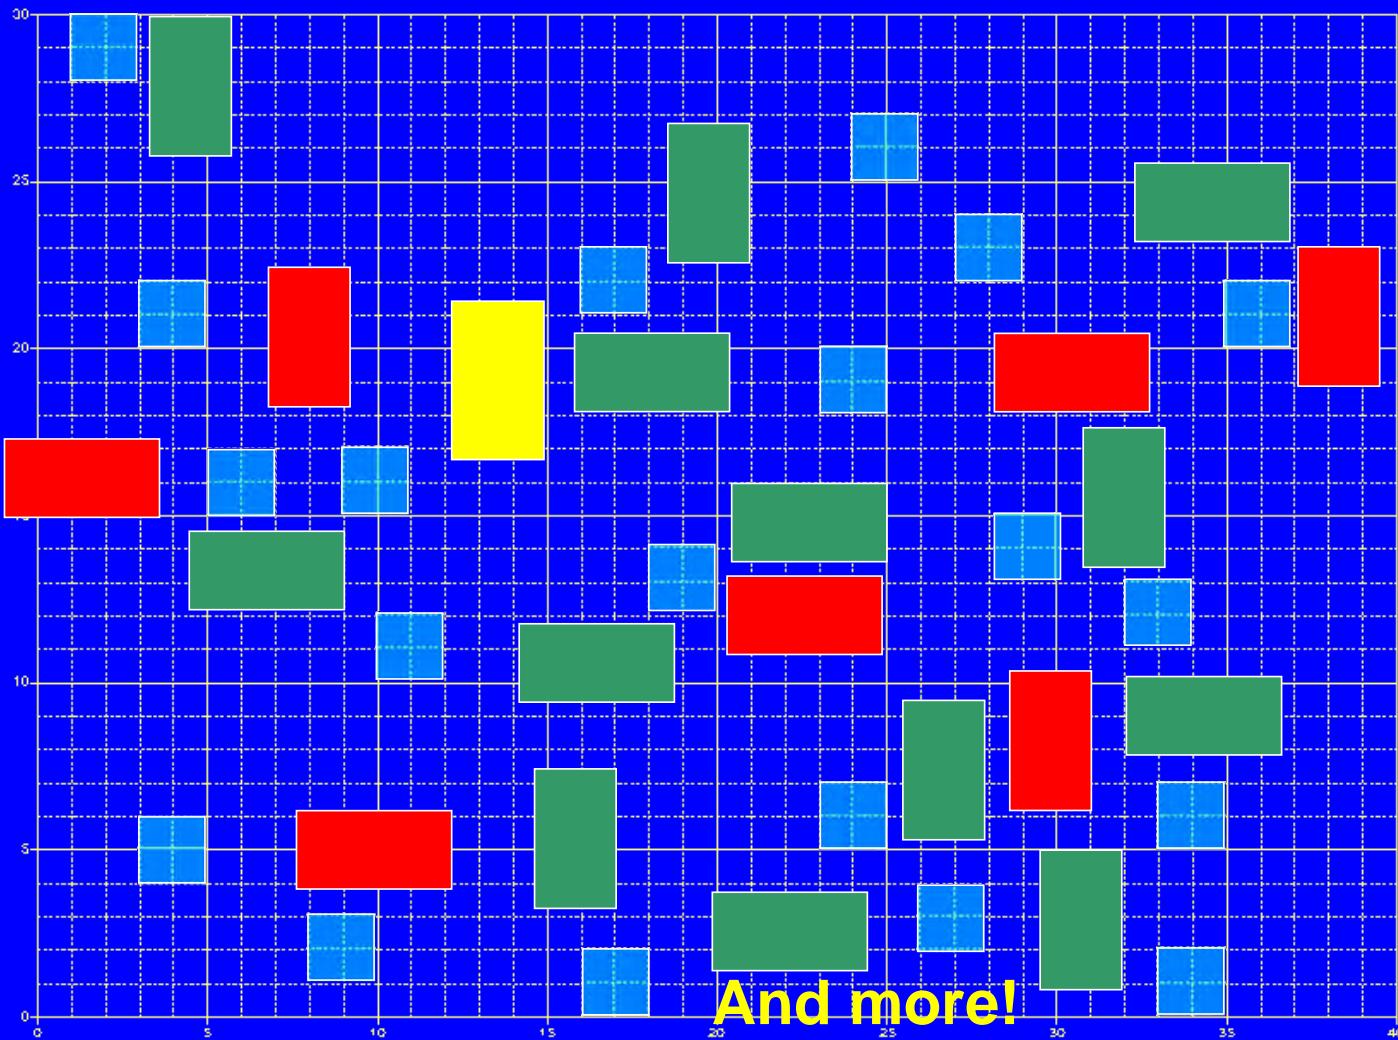

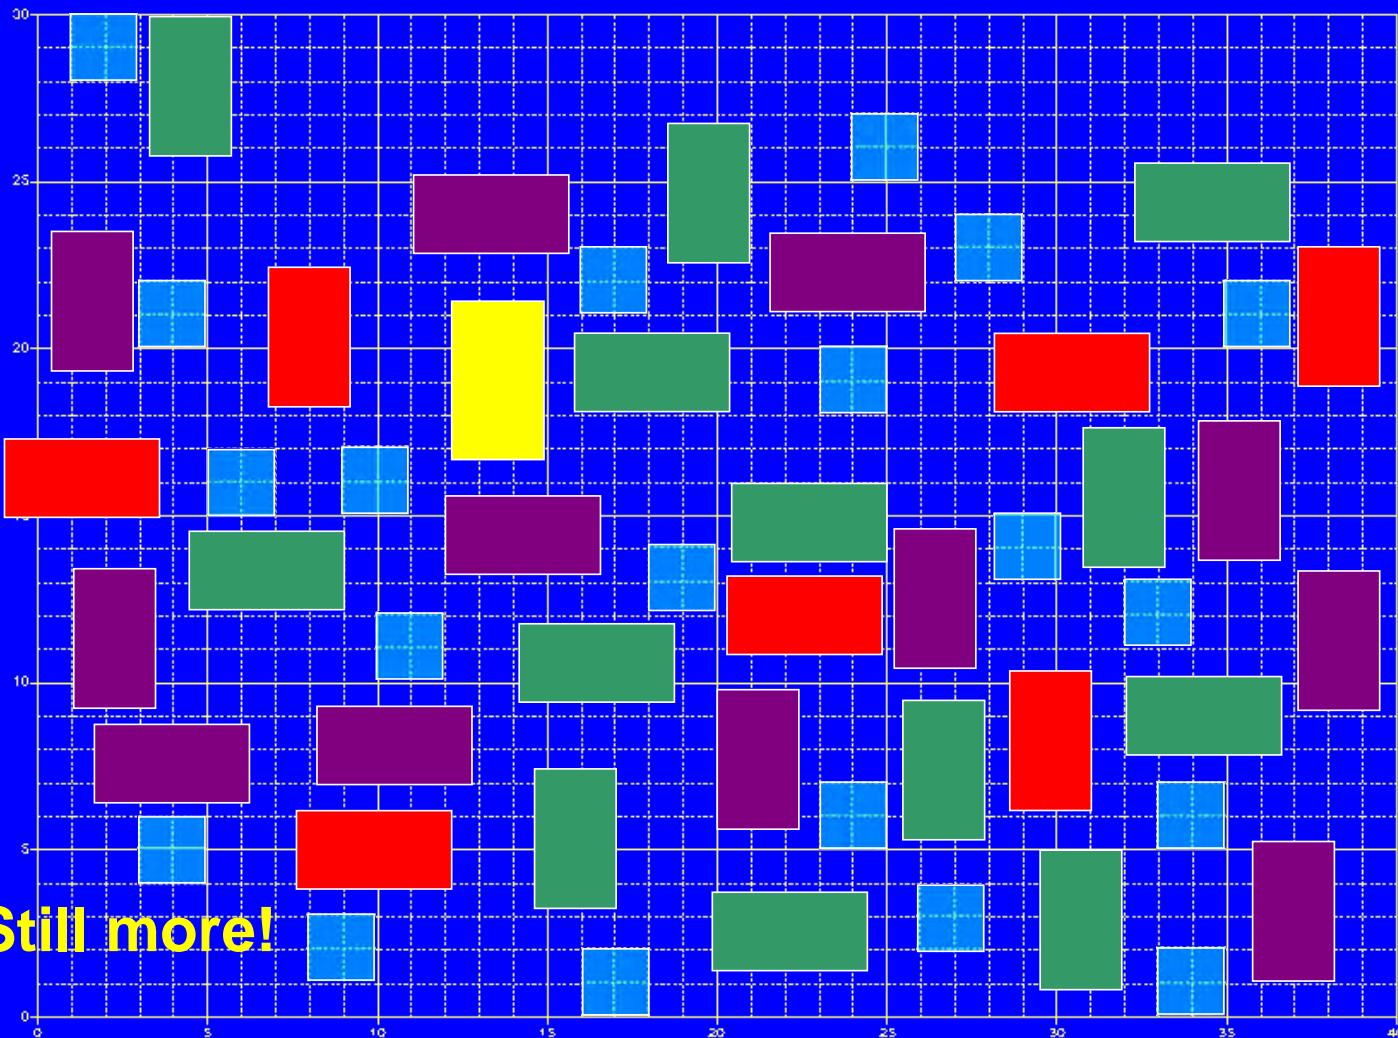

Random 2 m x 2 m excavations..

Lesson Learned No. 2

The odds of finding buried features is low when the sampling locations are widely spaced, and the targets are small compared to the sample separation distances.

It's simply about probability!

Lesson Learned No. 2

The odds of finding buried features is low when the sampling locations are widely spaced, and the targets are small compared to the sample separation distances.

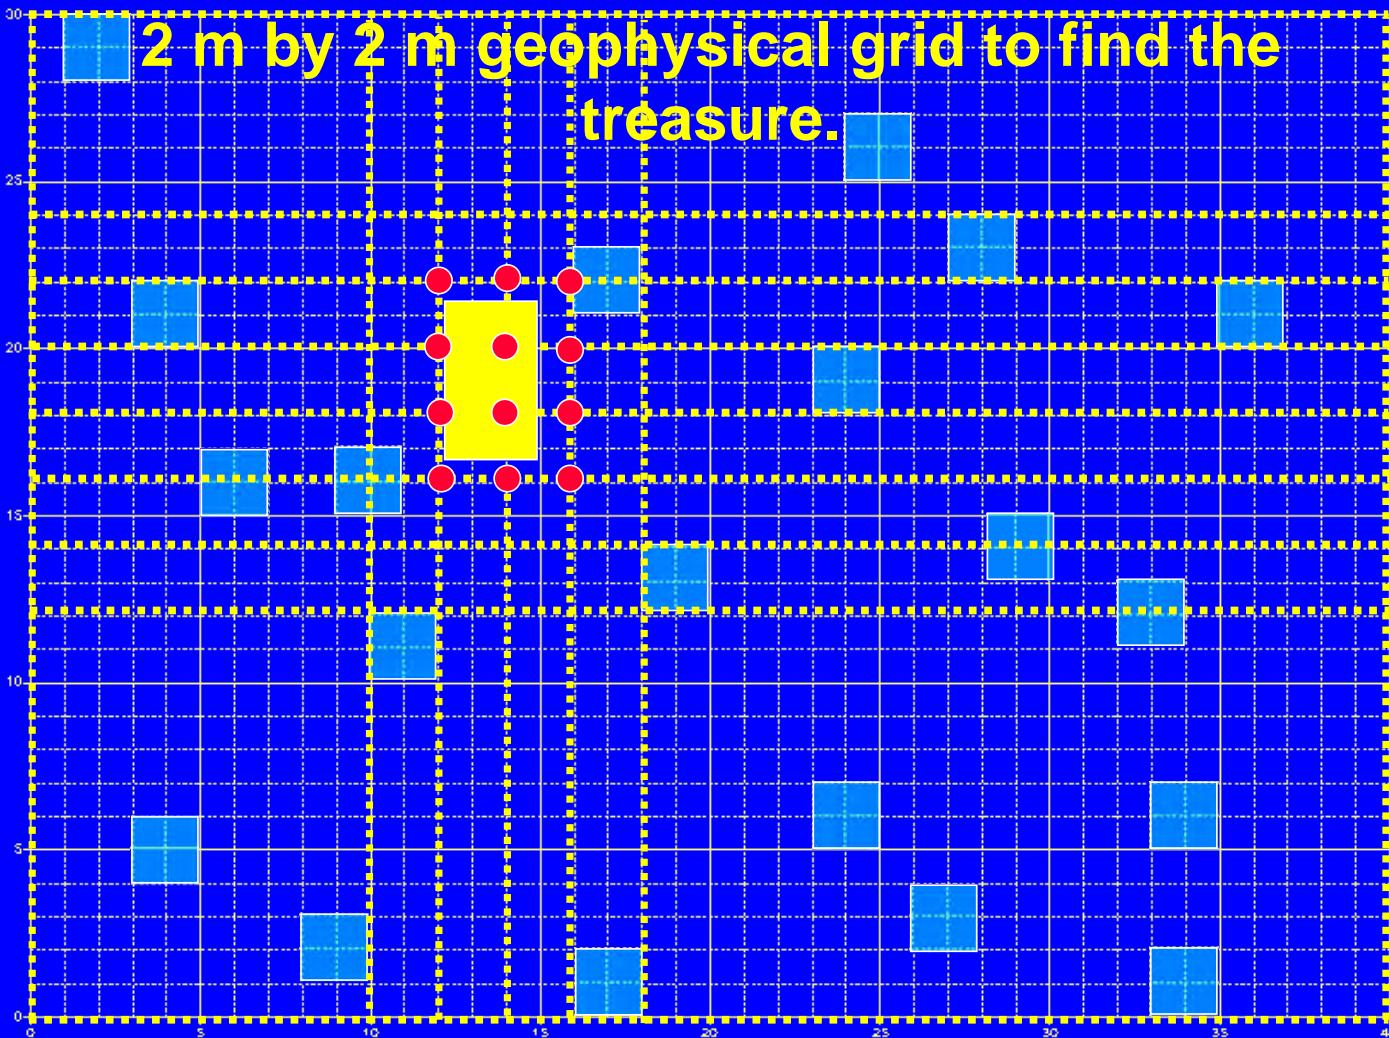

It's simply about probability!

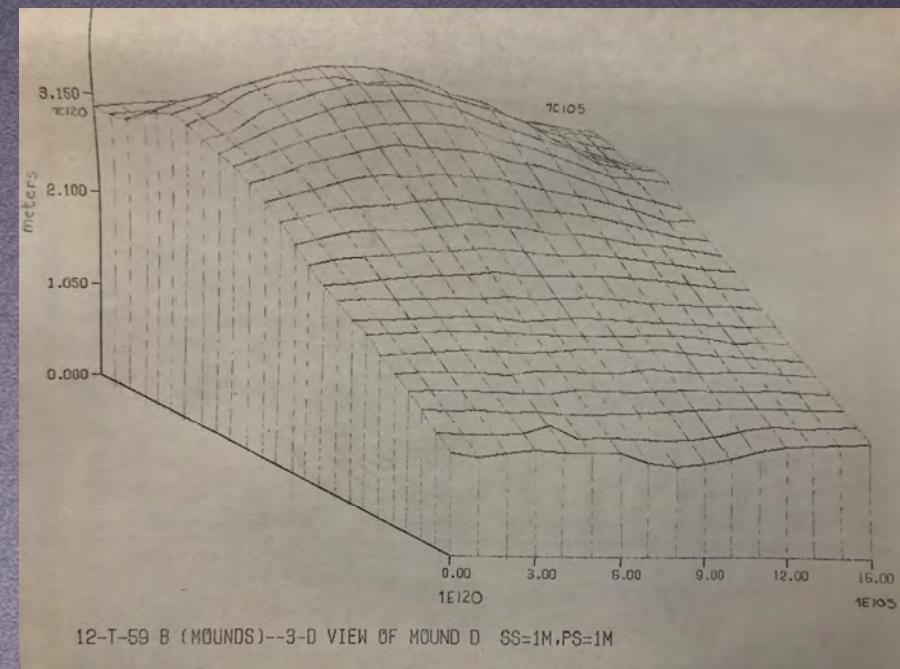

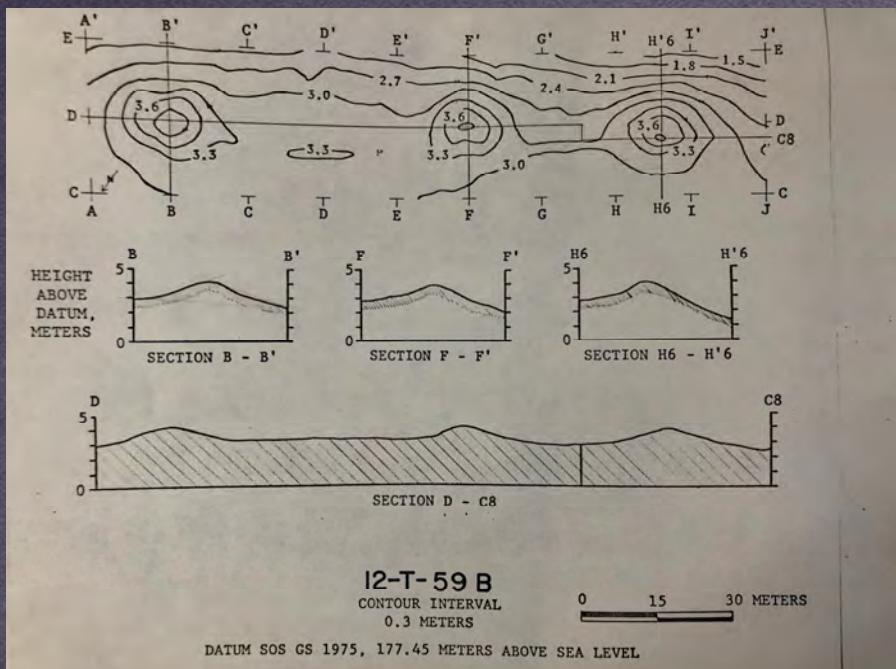

Question Is there a way to improve the odds?

It would have taken a

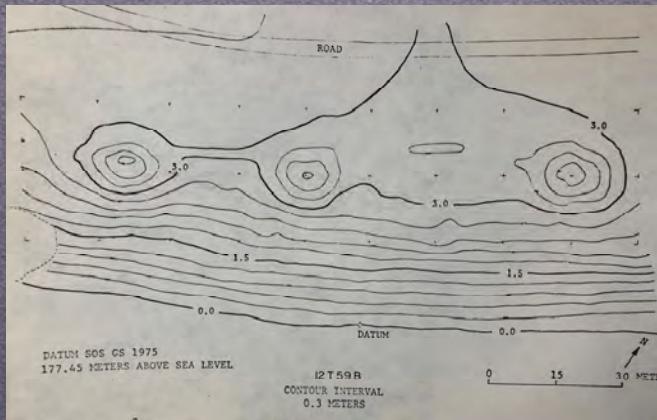

**2 m by 2 m geophysical grid to find the
treasure.**

SUMMER 1976

FIELD DATA COLLECTION

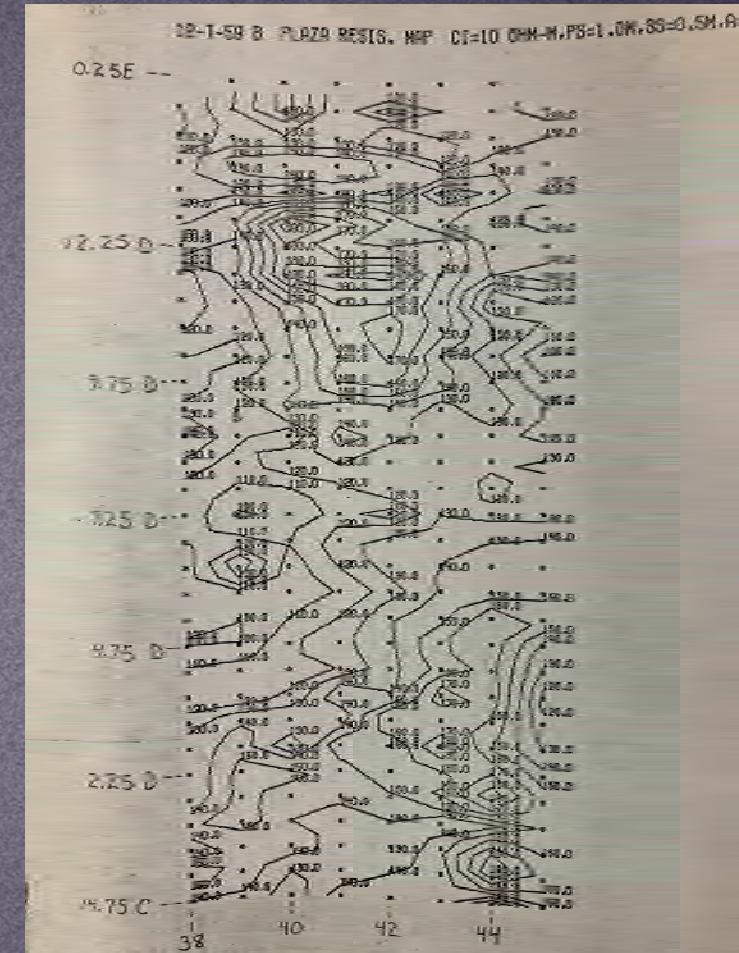

TOPOGRAPHY

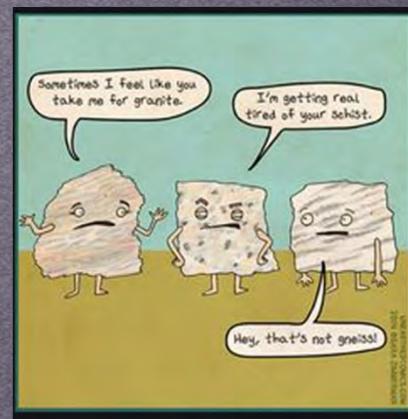

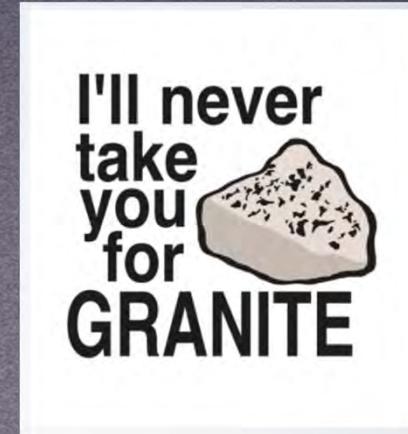

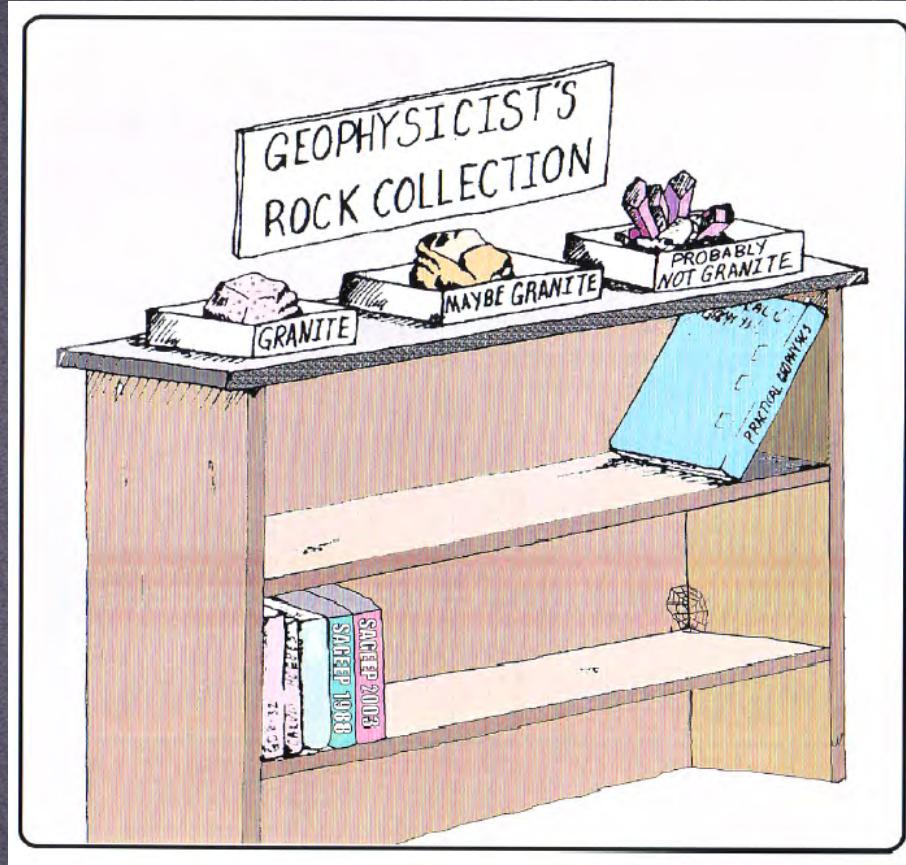

SUMMER 1976

MAGNETICS

RESISTIVITY

UNCERTAINTY

Lesson Learned No. 3

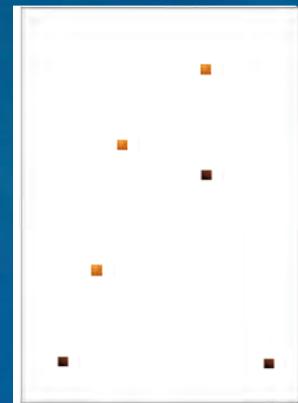

Even when you've collected good data from the field and have done everything right, if you are unable to communicate that data in a way that is convincing, people will not believe what you did has value.

You have to make your results look believable!

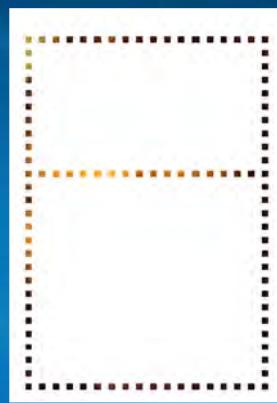

Question: How have we done that?

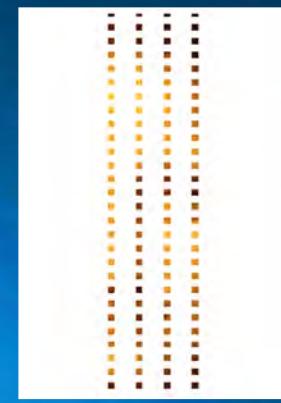

DATA ACQUISITION DENSITY AND ITS RELATIONSHIP TO MEETING CHARACTERIZATION OBJECTIVES

Random

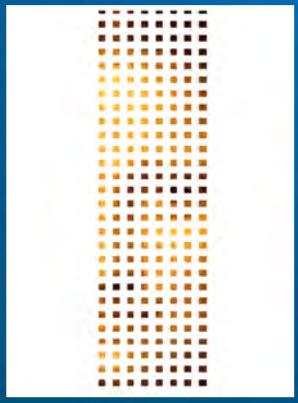

Single row, Perimeter

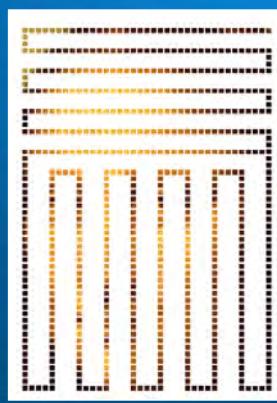

Low Density, Center

Single Row Cross

Medium density, Center

Low density, Meandering

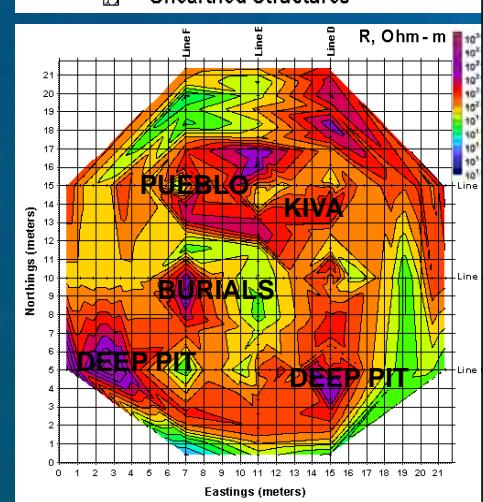

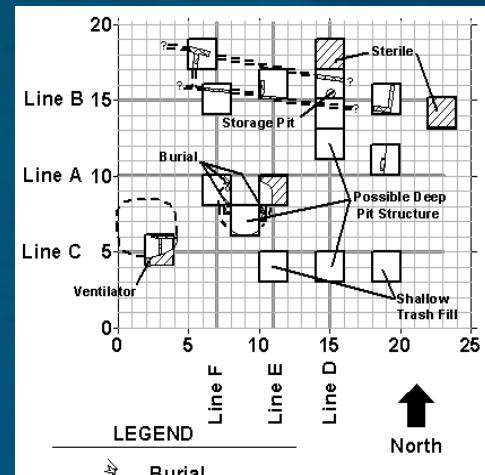

Medium density, target

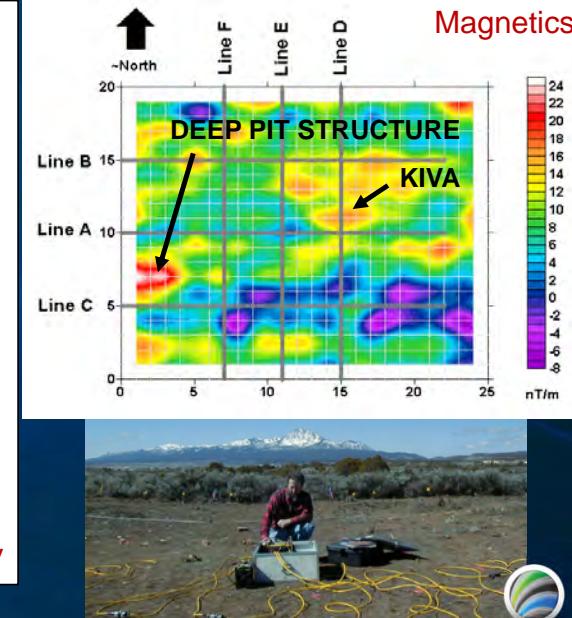

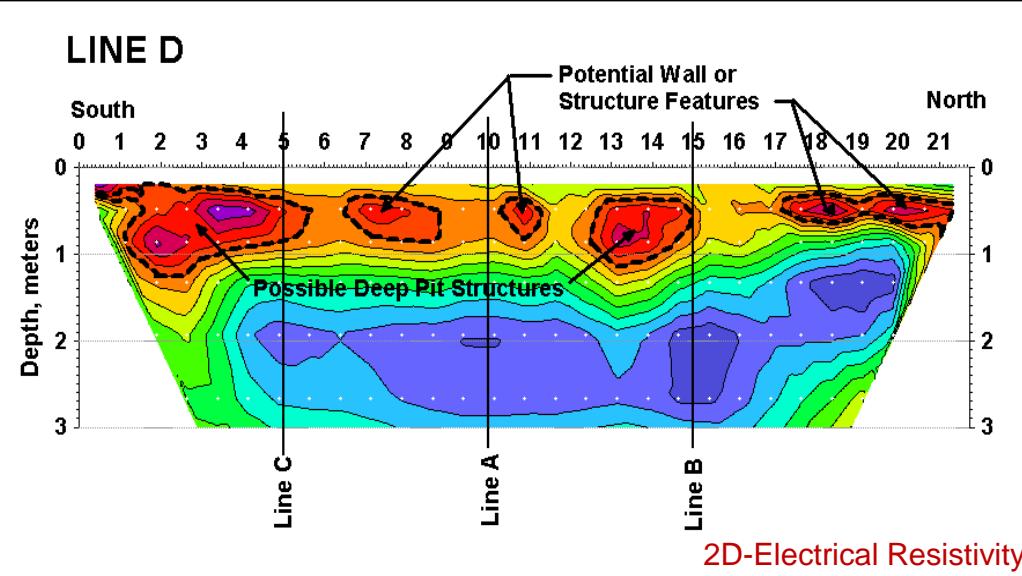

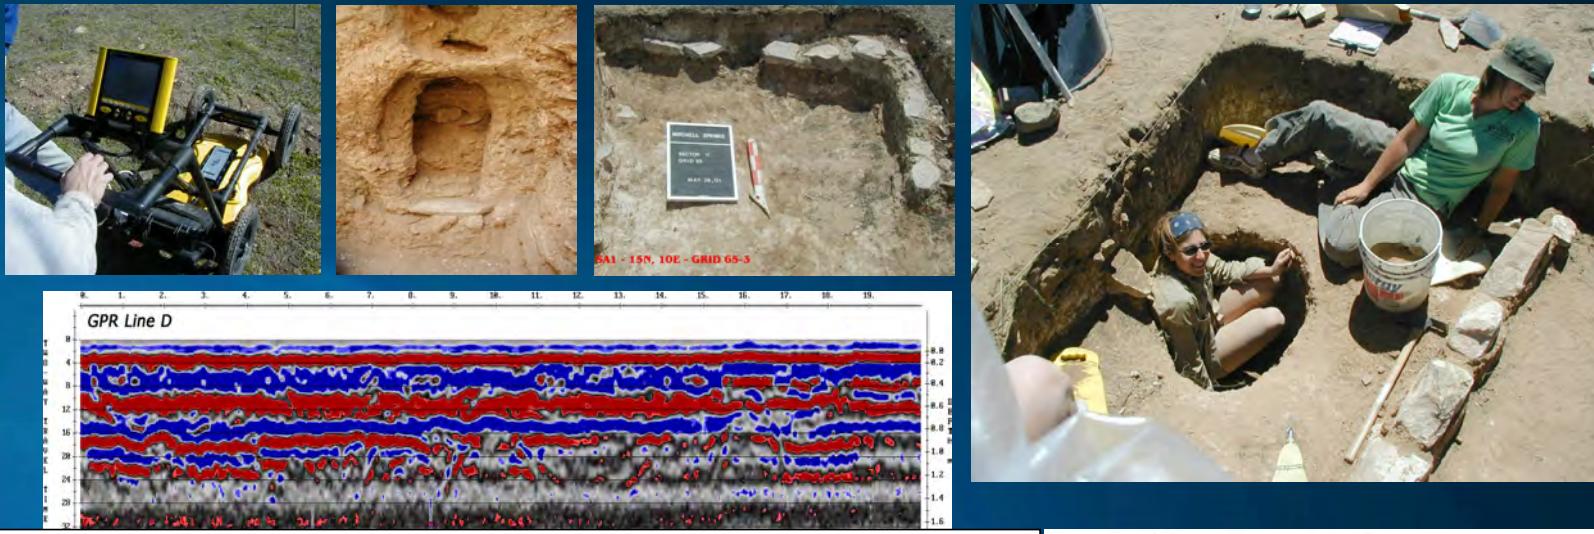

High density, target

SAGEEP 2002

Delineating Fill Materials with EM Methods

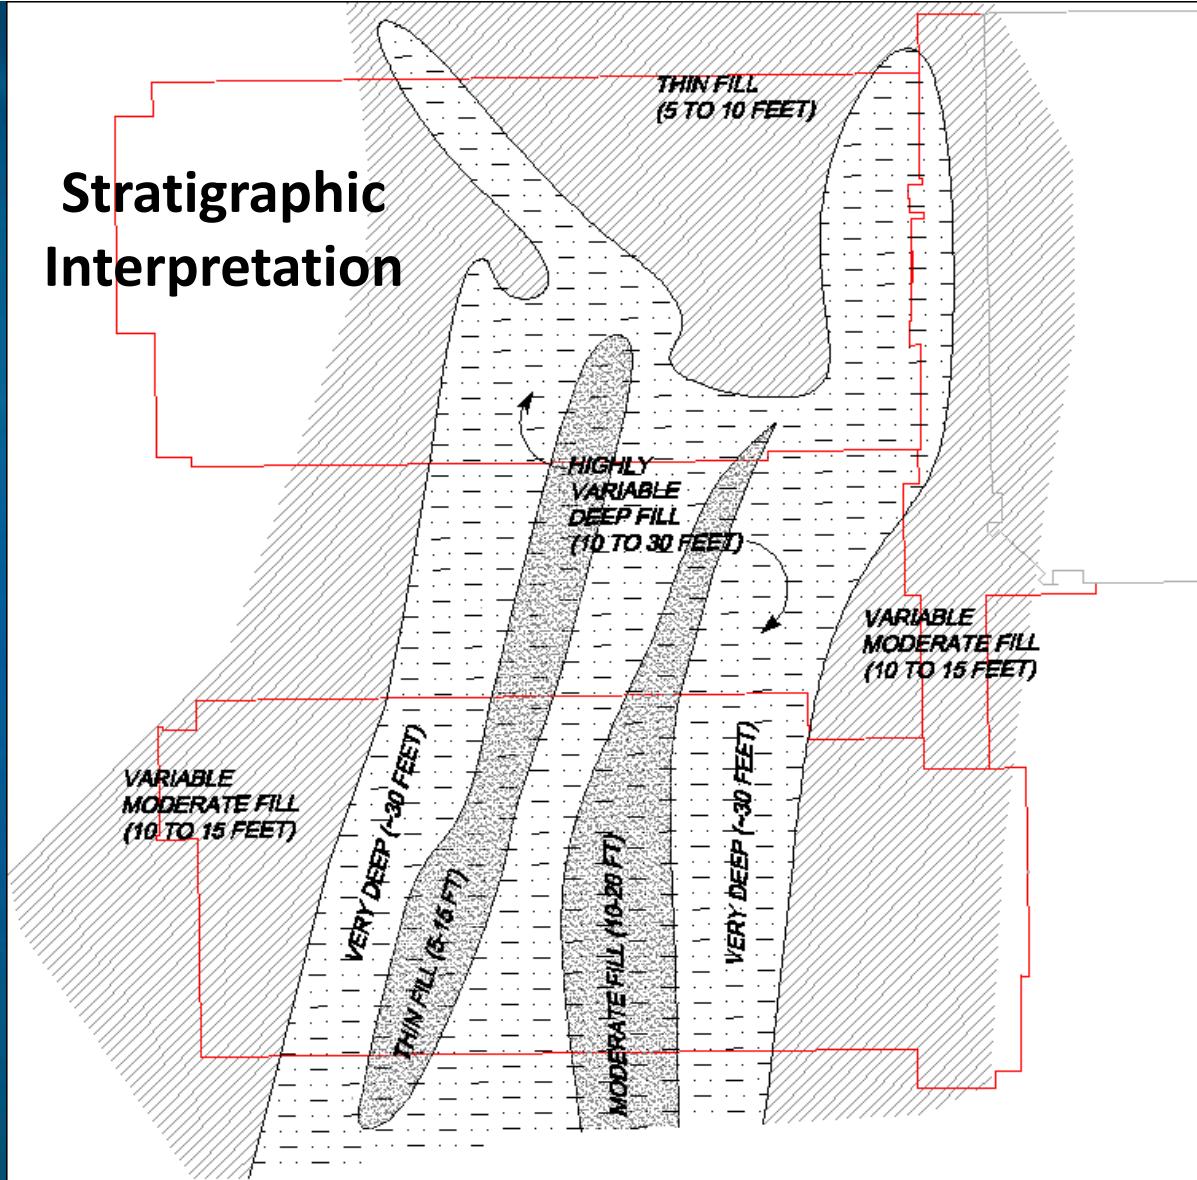

Fill Characterization

Fill Characterization

Stratigraphic Interpretation

Lesson Learned No. 4

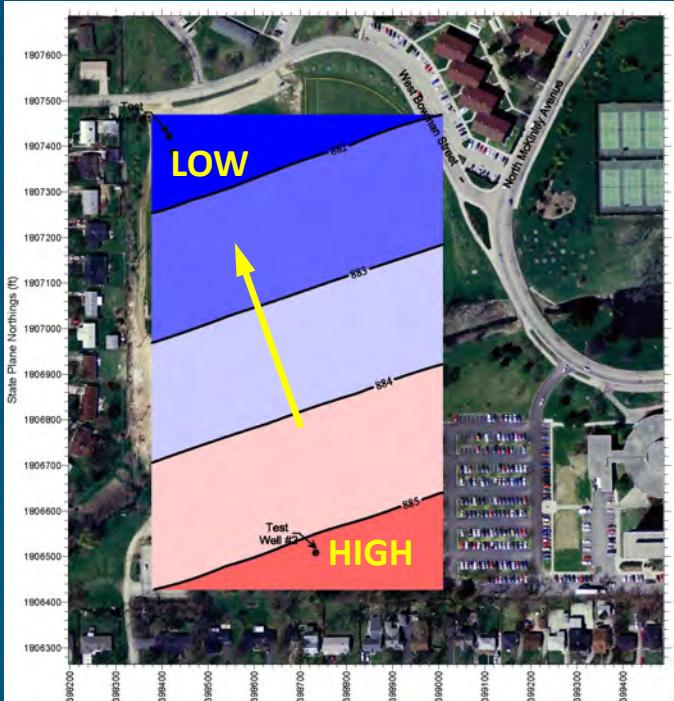

Believable results come in many forms:

- Accurate data
- High density data
- Selection of color schemes/contour intervals
- Annotations and labeling
- Various viewpoints and orientations
- Removal of extraneous information

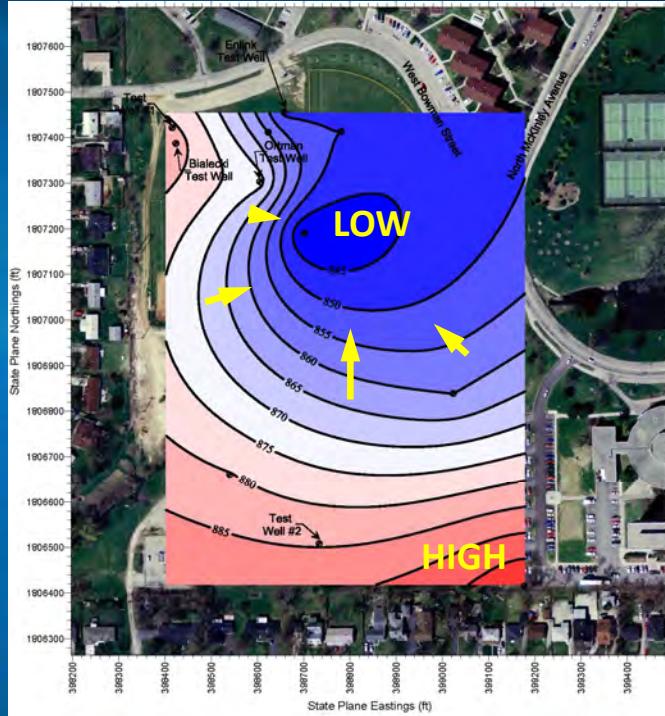

Question: How does a non-geophysicist see the world?

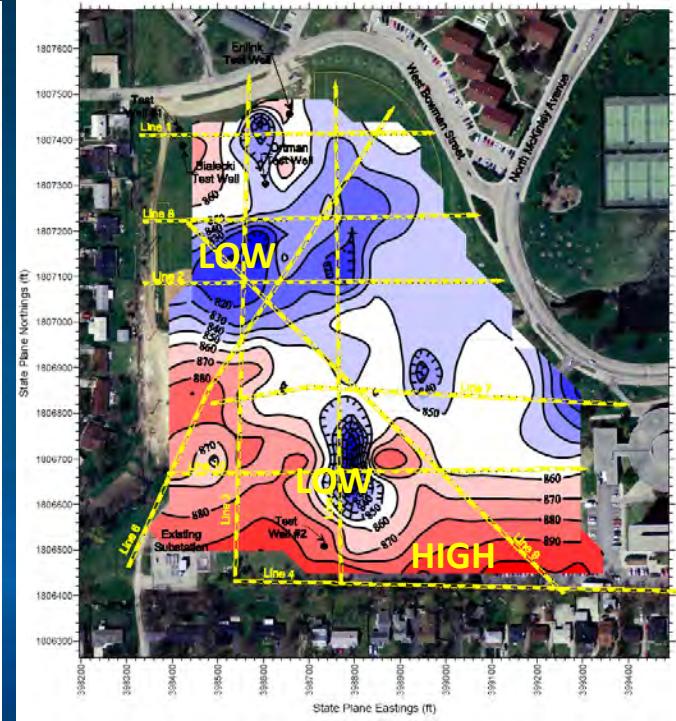

GEOTHERMAL WELL FIELD

TOP OF BEDROCK SURFACE
2-point Constant Sloping Model

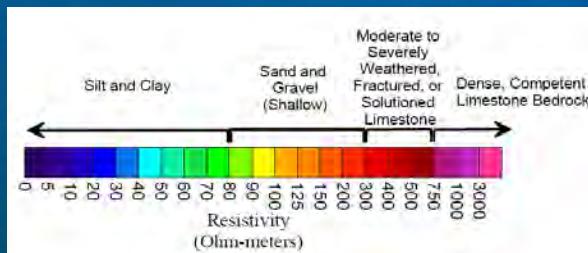

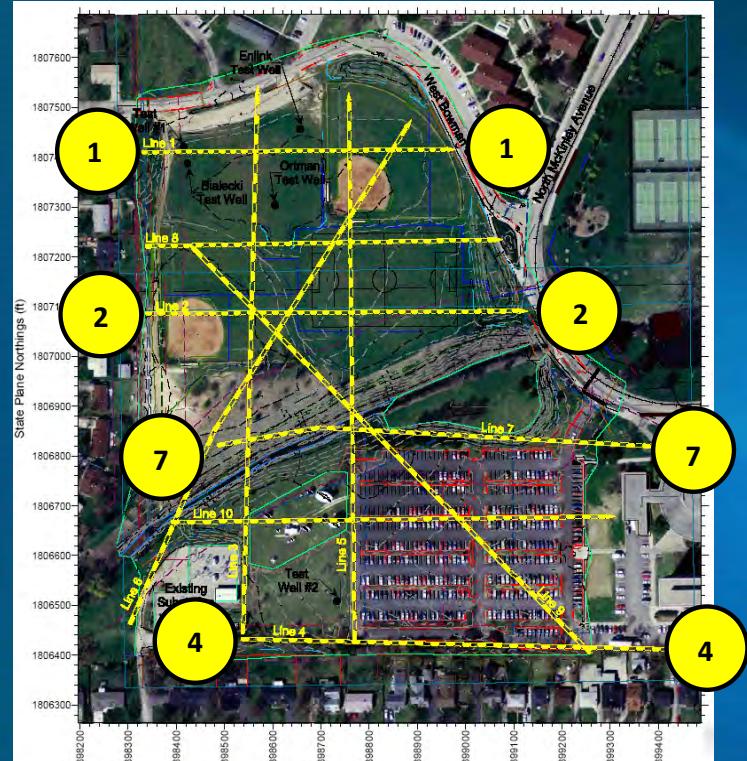

TOP OF BEDROCK SURFACE
11-point Boring Model

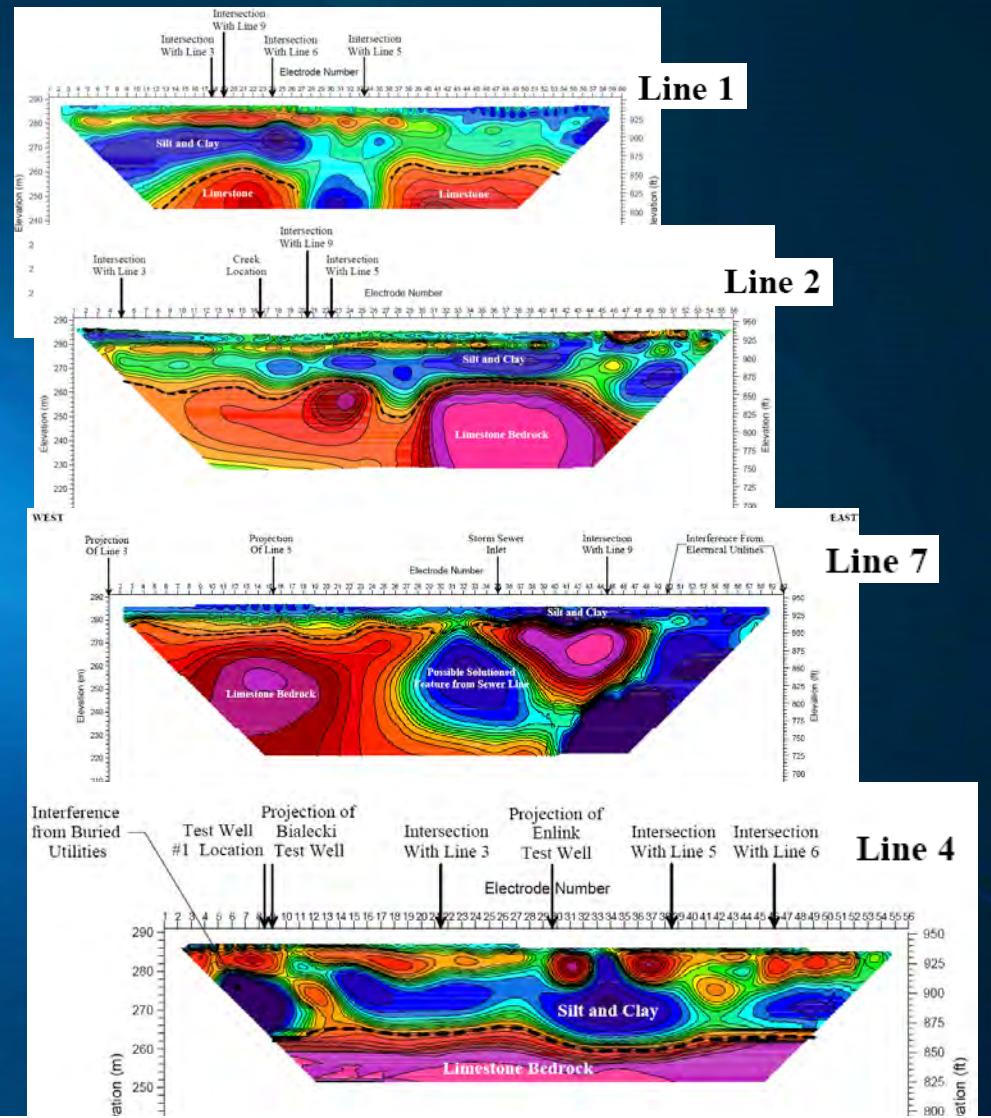

TOP OF BEDROCK SURFACE
700-point Geophysical Model

Conceptual Hydrogeologic Model

REMEDIATION IN KARST

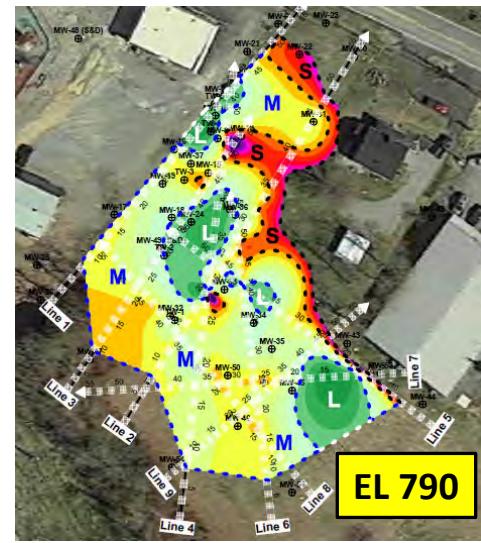

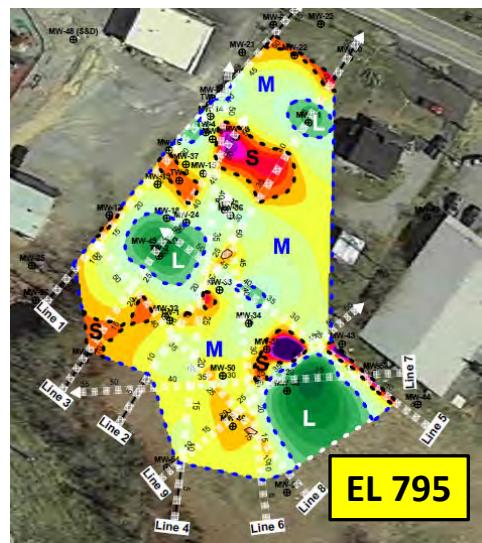

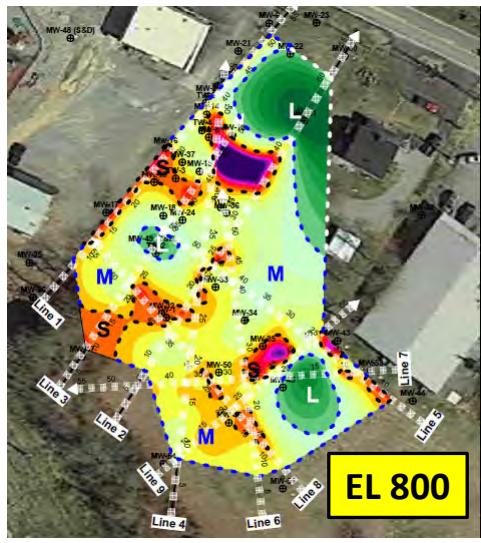

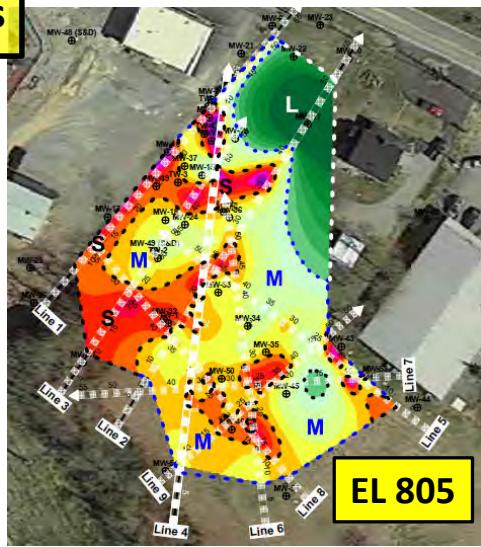

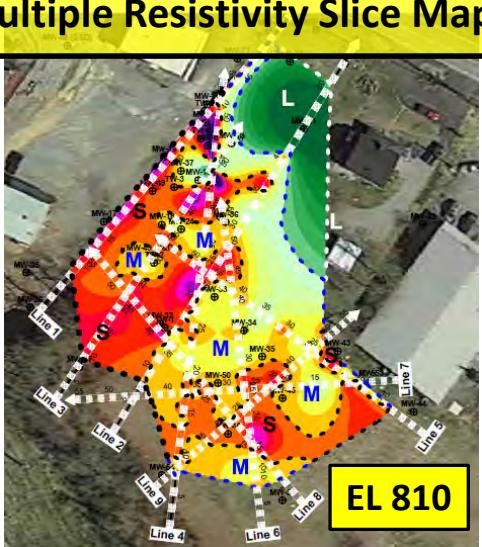

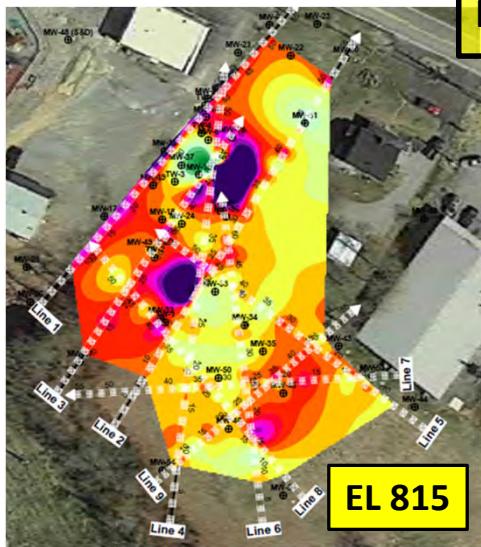

4

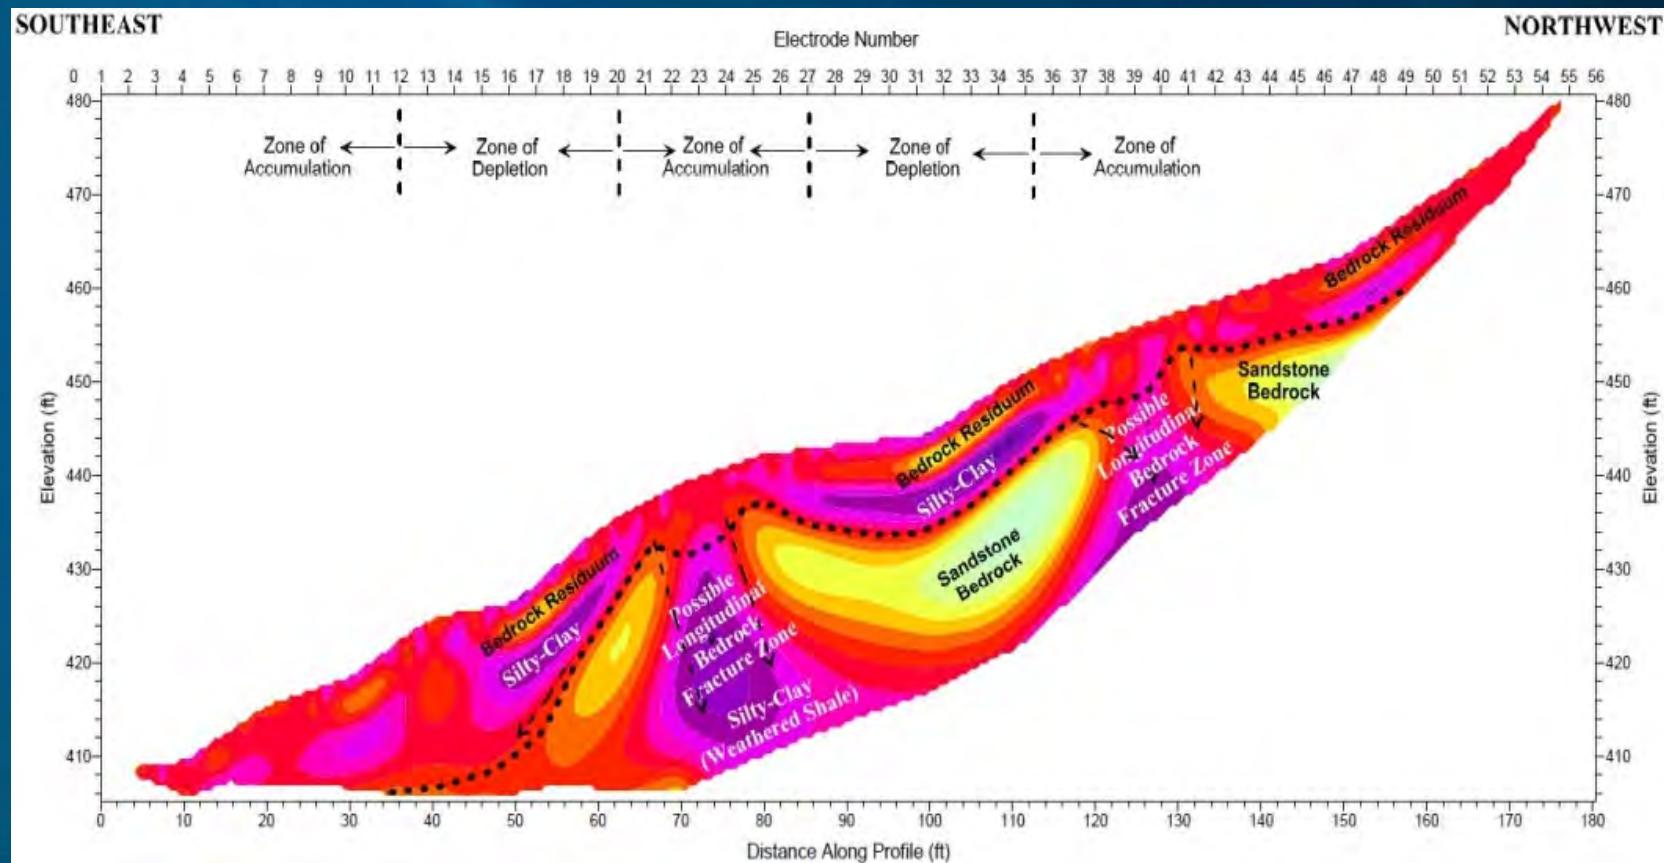

REMEDIATION IN KARST

Multiple Resistivity Slice Maps

TRANSPORTATION SLOPE STABILITY

Lesson Learned No. 5

When properly performed and displayed, geophysical results provide an unparalleled enhancement to conceptual site models that allow for improved understanding and better decision-making.

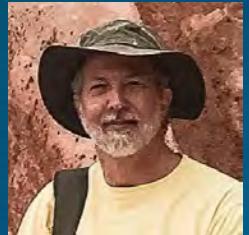

Closing Remarks

- Subsurface characterization is an exciting adventure!
- Data density is paramount to develop accurate site conceptual models.
- Visual communication of the results is more important than the average geophysicist thinks!
- Have confidence that when properly used, geophysics can be applied with great success in the engineering and environmental fields.
- Future advances in more rapid field data collection, enhanced processing and analysis, and advances in equipment design will allow even more success.

THANKS GEOPHYSICAL COLLEAGUES OVER THE YEARS!
